Note- use bootstrap

1- create a scope array that represents students data (id , full name , salary , married , birthdate)- the array contains 3 objects. And do the following

a- send data to view to be showed as a list (table)

b- show data as unordered list as 5:aly Mahmoud:2000:15 jan 2013

c- use a check box to control the show one of the previous views . if the check box checked the table view is shown otherwise the list is shown

d- use the table header in a to sort table data according to the clicked col

e-show the salary as $2000.30 , date as "Thursday 20 jan, 2013" .

f- use a dropdown list includes 1,2,3 – when 1 selected the table will show only one row , and when 2 selected the table will show 2 rows and so on

g- allow the usr to search about a specific student using name of the student. User can enter the required string in a textbox and any students contains in his name this string will only appears in the table.

g- make a form to enter student data and a button when clicked data will be added in the array.
